Phase 2b: the pairs replicate in new patients and match known biology

a

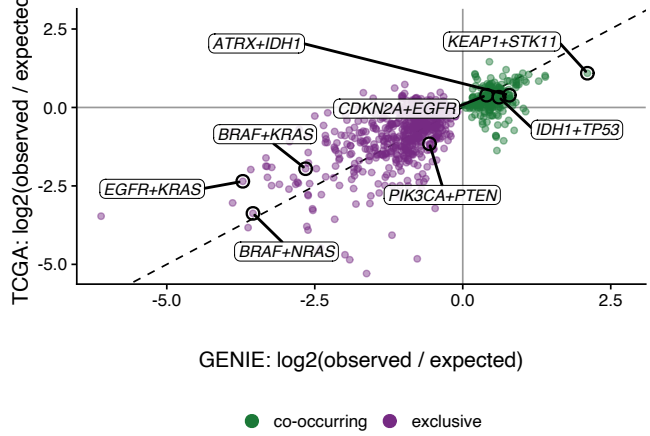

TCGA (independent patients) confirms the pairs

Replicated candidates significant in the opposite direction in TCGA: 0.

b

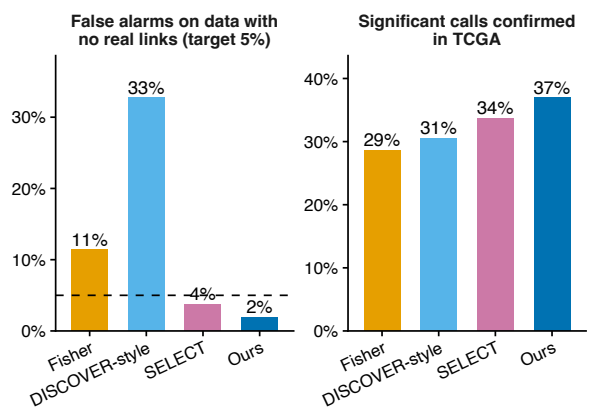

Effects agree across the two cohorts

765 candidates testable in both; Spearman rho = 0.74. Dashed line = equal effect. Circled: well-known pairs.

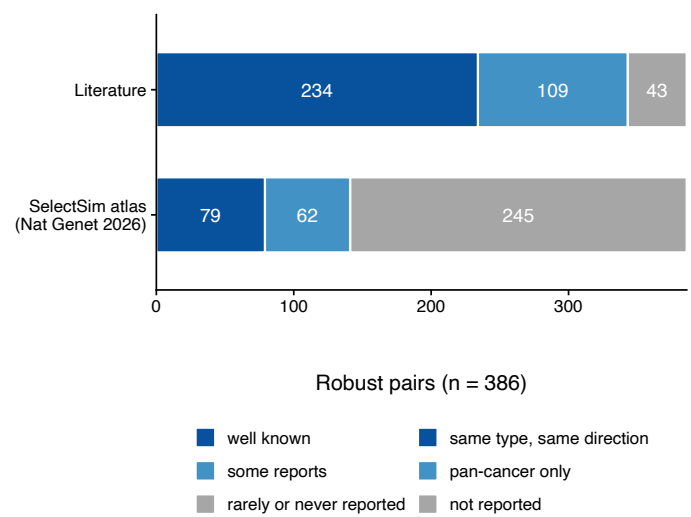

c

Our test vs published methods, on identical data

d

Most pairs are known biology

SelectSim: none in the opposite direction. It covers mutations only, so copy-number and fusion pairs cannot appear there.
