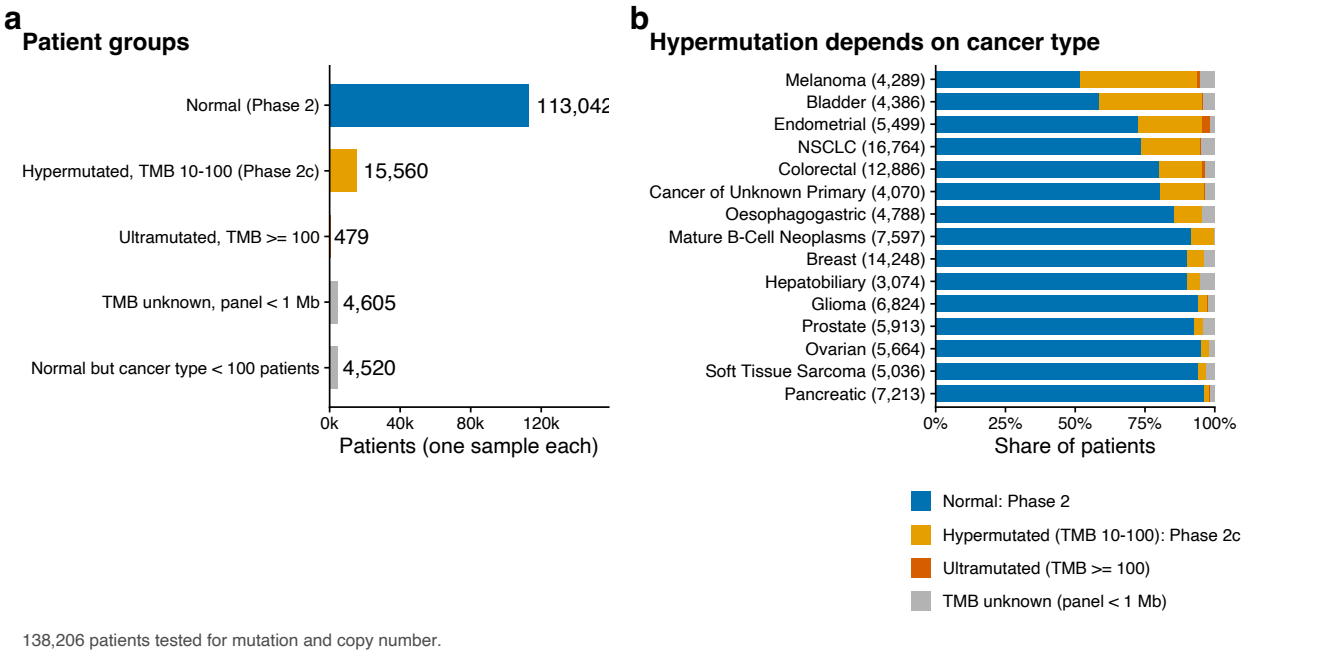
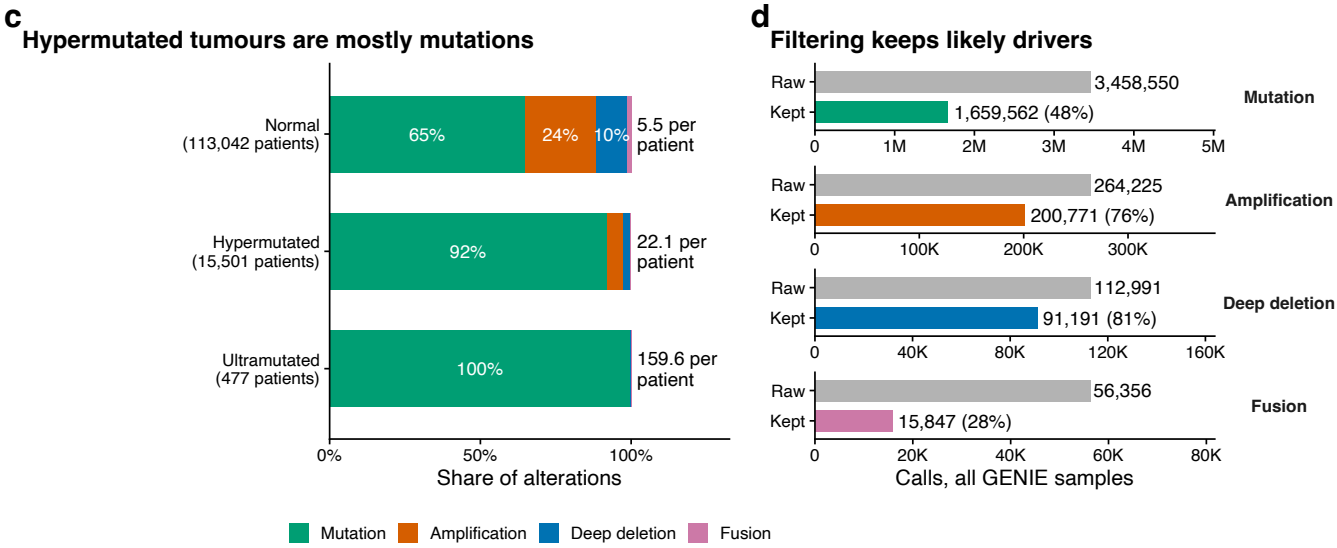
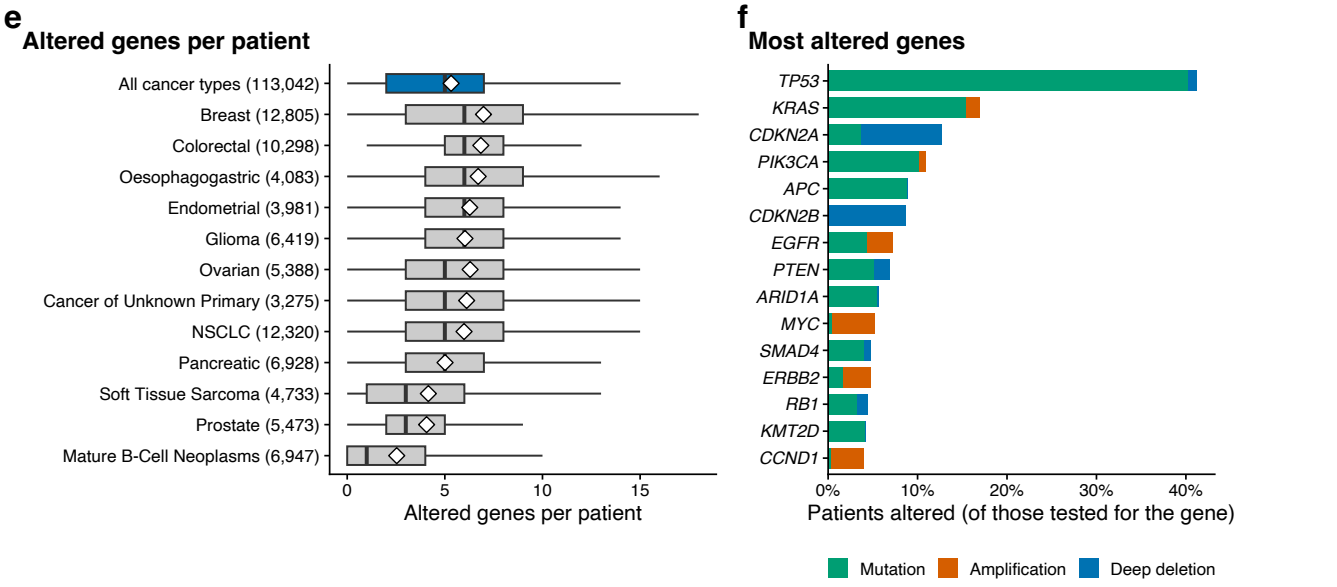
Phase 1: 113,042 normal patients and their alterations, ready for Phase 2



138,206 patients tested for mutation and copy number.





Box = quartiles with median, diamond = mean, whiskers = 1.5 x IQR.
Median 1 (B-cell) vs 6 (colorectal): one shared cut-off would misjudge both, so Phase 2 tests within each cancer type.

Genes tested in at least half the patients. A patient with two types counts in both. Fusions are not shown here.
